

ATLAS

MASTER CRM + EDG + AI WORKFORCE SYSTEM PROMPT

Fusion AI / Fusion Tech - Complete instruction for Claude Code. Atlas already exists; this document tells Claude Code how to audit, extend and complete the existing system.

0. CRITICAL RULE - ATLAS ALREADY EXISTS

Atlas already exists. Do not create another agent, Atlas 2, or a replacement project. Audit the existing repository first: architecture, database/schema, authentication, CRM, EDG modules, dashboards, APIs, environment variables, existing agents, workflows, Vercel configuration and integrations. Identify what works, what is partial, what is missing, duplicated logic, security problems and broken workflows. Preserve working functionality. Sequence: AUDIT -> UNDERSTAND -> IMPROVE -> CONNECT -> COMPLETE -> TEST.

1. WHAT ATLAS IS

Atlas is not merely a chatbot, CRM, dashboard or automation tool. Atlas is the central business operating intelligence and orchestration layer. CRM remembers customers. EDG is our company-wide digital operations layer connecting departments, data and workflows. AI agents execute specialized work. The database is the structured source of truth. Automations move work. Integrations connect external systems. The dashboard gives management visibility and control. Atlas coordinates the entire connected system.

2. CORE BUSINESS MISSION

Every feature must reduce repetitive manual work, reduce errors, prevent missed follow-ups, improve response speed, connect departments, improve productivity/customer experience, increase sales opportunities, automate routine operations, improve management visibility and save time. Every feature must answer: WHAT BUSINESS PROBLEM DOES THIS SOLVE? The objective is not more screens; it is a more intelligent, connected and automated business.

3. INDUSTRY-ADAPTABLE

Use modular architecture for retail, e-commerce, beauty, clinics, dental, F&B, catering, property, insurance, renovation, automotive, luxury retail, professional services, accounting, marketing, education, SMEs and larger companies. Enable only the modules each client needs.

4. NEW CLIENT ONBOARDING

Capture industry, products/services, branches, departments, employee count, sales process, customer journey, current software, CRM, email, WhatsApp, accounting, payments, calendar, inventory, marketing, manual tasks, sales leaks, missed follow-ups, duplicated data, automation opportunities, approval requirements and management reporting. Produce a Business Automation Blueprint covering integrations, users, permissions, pipelines, AI/human responsibilities, approvals, KPIs, dashboards and implementation priorities.

5. CONNECTED BUSINESS DATA MODEL

Connect organizations, branches, departments, locations, customers, leads, prospects, employees, managers, suppliers, vendors, partners, conversations, enquiries, appointments, quotations, purchases, invoices, follow-ups, support cases, opportunities, pipeline stages, tasks, projects, approvals, SOPs, tickets, HR records, products, SKUs, warehouses, stock, purchase orders, payments and reporting. Avoid isolated data silos.

6. COMPLETE CUSTOMER JOURNEY

Customer contact -> source identified -> identity/duplicate check -> CRM create/update -> intent classified -> answer/route -> qualify -> collect information -> opportunity -> assign owner -> next action -> follow-up -> appointment/quotation -> negotiation -> won/lost -> order/payment -> fulfillment/service -> post-sale follow-up -> feedback/review -> retention/reactivation. Record important events throughout.

7. CRM - CUSTOMER MEMORY

The CRM must immediately show who the customer is, what they asked, source, conversation history, promises, purchases, spend/value, quotations, appointments, deal stage, next action, owner, follow-up date and whether they are being forgotten. Provide one unified customer timeline.

8. OMNICHANNEL COMMUNICATION

Where permitted, connect WhatsApp, email, website forms/chat, social leads and supported calls to the correct customer/account. Goal: ONE CUSTOMER -> ONE CONNECTED HISTORY, subject to permissions, consent and applicable requirements.

9. WHATSAPP WORKFLOW

Message received -> identify customer -> search CRM -> retrieve permitted context -> classify intent/urgency -> decide AI vs human -> respond/escalate -> save activity -> update CRM -> create task/opportunity/appointment if needed -> schedule follow-up -> report outcome. Support human takeover, confidence thresholds, approvals, business hours, opt-outs, preferences and audit logs. Never claim a message was sent without provider confirmation.

10. EMAIL INTELLIGENCE

Identify important mail, match CRM records, classify enquiries, summarize threads, detect unanswered messages, extract actions, create tasks, draft replies, escalate important matters and record interactions. External sending follows permissions and approval policies.

11. SALES PIPELINE

Support configurable stages such as New Lead -> Contacted -> Qualified -> Appointment -> Proposal/Quotation -> Negotiation -> Won/Lost -> Reactivation. Track owner, value, source, stage, last contact, next action/date, inactivity, quotation, communications, notes, documents and lost reason. Detect stale leads, missed follow-ups, unanswered leads, quotes without response and important opportunities.

12. FOLLOW-UP ENGINE

Continuously determine WHO needs follow-up, WHY, WHEN, BY WHOM, through WHICH channel, what happened last and what should happen next. Example: quote sent -> no response within configured period -> create contextual follow-up -> AI sends if authorized or salesperson gets task -> record response -> update opportunity -> schedule next action. Timing is configurable.

13. SPECIALIST AGENT COORDINATION

Do not replace existing specialist agents. If JOHN is the client-facing sales agent, John handles sales conversations while Atlas coordinates company data, CRM, tasks, workflows, follow-ups, departments, downstream agents and management intelligence. Atlas is the orchestrator.

14. HR OPERATIONS

Support employee directory, departments, roles, permissions, onboarding/offboarding, leave, attendance integration where needed, training, documents, tasks, approvals and appropriate KPI information. Consequential decisions such as hiring, termination, discipline, compensation and promotion remain human-controlled.

15. INVENTORY

Track product, SKU, location, warehouse, current/reserved/available stock, reorder level, supplier, cost, movements, returns and purchase orders. Sale confirmed -> stock action -> movement record -> dashboard -> threshold check -> alert -> purchase request if configured -> authorized approval. Detect low/out-of-stock and unusual movement.

16. ORDERS & FULFILMENT

Order created -> customer linked -> payment status -> inventory reserved -> fulfilment task -> packing -> shipping/collection -> tracking -> delivery -> completion -> post-sale follow-up. Exceptions generate alerts/workflows.

17. FINANCE & ACCOUNTING INTEGRATION

Connect to proper finance/accounting/payment systems instead of pretending Atlas is a complete accounting system. Deal won -> invoice workflow -> approved accounting system -> CRM link -> payment monitoring -> reporting. Sensitive financial actions require authorization.

18. APPOINTMENTS & CALENDAR

Request -> check permitted availability -> propose slots -> selection -> booking -> CRM update -> confirmation -> reminder -> employee notification -> outcome -> follow-up. Support reschedule, cancel, complete and no-show.

19. MARKETING INTELLIGENCE

Connect Campaign -> Leads -> Qualified Leads -> Appointments -> Opportunities -> Sales -> Revenue. Where supported ingest spend, impressions, clicks, leads, CPL, conversions, revenue and ROAS. Identify which campaigns generate customers/revenue and which marketing leads were not contacted.

20. TASK & OPERATIONS

Every action has owner, department, priority, deadline, status, related customer/project, dependencies, notes and audit history. Detect overdue, blocked, unassigned and high-priority work.

21. CUSTOMER SERVICE

Manage questions, complaints, service/refund requests, technical issues, escalations and feedback. Track customer, issue, priority, owner, status, response time, resolution and history. Escalate urgent/sensitive cases.

22. DOCUMENT & COMPANY KNOWLEDGE

Connect approved SOPs, FAQs, products/services, price lists, quotations, proposals, contracts, policies and training. Ground AI answers in approved knowledge. Never invent prices, discounts, policies, specifications, contract terms, refunds or delivery promises. If uncertain, ask/escalate.

23. CEO / MANAGEMENT COMMAND CENTER

Dashboard is the control room. Surface enquiries, leads, appointments, sales, revenue, follow-ups, tasks, customer issues, low stock and approvals; pipeline/conversion/sources; customer activity; operations; HR; inventory; finance; and AI actions, approvals, escalations, failures and agent status.

24. MORNING MANAGEMENT BRIEF

Generate from REAL DATA: yesterday's leads, appointments, sales/revenue; attention required; today's appointments/follow-ups/quotes; and top priorities. Never fabricate. If unavailable say DATA NOT AVAILABLE.

25. NATURAL-LANGUAGE COMMAND CENTER

Authorized users can ask about sales, revenue, overdue leads, follow-ups, appointments, stock, invoices, approvals, priorities, customer summaries, campaigns, yesterday's activity and department work. For 'why' questions separate facts from inference and show evidence.

26. EVENT-DRIVEN ARCHITECTURE

Use events such as lead.created, message.received, lead.qualified, appointment.booked/cancelled, quote.sent, deal.won/lost, order.created, payment.received, invoice.overdue, stock.low, task.overdue, complaint.created, employee.created and leave.requested. Events trigger connected workflows.

27. AUTOMATION RULE ENGINE

Rules support TRIGGER + CONDITIONS + ACTIONS + OWNER + APPROVAL + ESCALATION + AUDIT LOG. Avoid hard-coding every workflow.

28. HUMAN-IN-THE-LOOP

Level 1 Auto: low-risk classification, summarization, alerts, routine tasks, sync. Level 2 Approval: selected external messages, discounts, quote changes, purchase requests, campaigns, refunds. Level 3 Human Only: major payments, employment termination, major legal/contract decisions, sensitive HR, high-risk finance, security changes and destructive deletion.

29. APPROVAL CENTER

Centralize approvals with requester, reason, related entity, amount where relevant, supporting context, deadline and appropriate AI recommendation/context. Actions: Approve, Reject, Request Changes. Audit all decisions.

30. ROLE-BASED ACCESS CONTROL

Roles may include CEO/Owner, Manager, Sales, Customer Service, HR, Finance, Warehouse, Marketing and Admin. Enforce authorization at backend/data/API level, not only UI.

31. DATABASE = SOURCE OF TRUTH

Conversational memory is not authoritative business data. Convert instructions into validated structured records. Conversation -> Understand -> Validate -> Structured Data -> Database -> Workflow -> Action -> Result -> Audit Log.

32. SINGLE CUSTOMER VIEW

Use customer IDs plus appropriate phone/email/external IDs. Connect conversations, opportunities, appointments, orders, invoices, cases, documents, tasks and history. Detect duplicates; use safe merge; never auto-merge ambiguous records.

33. AUDIT TRAIL

Record WHO, WHAT, WHEN, entity, human/AI, agent/workflow, previous/new values where appropriate, approval, approver, success/failure and errors. Protect sensitive audit records.

34. API & INTEGRATION ARCHITECTURE

Use adapters/connectors rather than tightly coupling core logic. Potential integrations include approved WhatsApp providers, Respond.io, email, Google/Microsoft calendars, existing CRMs, accounting, payments, Shopify/e-commerce, Meta/TikTok/Google ads and other business APIs. Never fake success. Keep secrets server-side.

35. ERROR HANDLING & RELIABILITY

Handle timeout, rate limits, auth failure, provider outage, duplicate events, partial failure and retry safety. Use idempotency where appropriate. Never duplicate invoices/messages/orders/payments due to retries. Failed automations go to a visible exception queue.

36. OBSERVABILITY

Show integration status, last successful sync, workflow failures, queued jobs, agent failures, API errors and important health indicators so admins know when automation is not working.

37. SECURITY & PRIVACY

Use strong authentication, authorization, least privilege, server-side secrets, validation, secure sessions, encrypted transport, appropriate storage controls, audit logs, safe files and tenant isolation. Never expose one client's information to another.

38. MULTI-TENANT READINESS

If serving multiple companies, enforce strict organization/tenant isolation on every relevant record, query and action. Never rely only on front-end filtering.

39. DASHBOARD DESIGN

Prioritize action over decorative graphs. First view answers: What happened? What needs attention? What requires approval? What should I do next? Then drill into CRM, Sales, Customers, Operations, HR, Inventory, Finance, Marketing, AI Workforce, Automations, Approvals and Settings.

40. GLOBAL SEARCH / COMMAND BAR

Authorized users can find customers, leads, employees, products, orders, invoices, tasks, documents and workflows. Natural-language commands become structured validated actions and require confirmation when consequential.

41. NOTIFICATION CENTER

Centralize alerts for follow-ups, important leads, complaints, stock, invoices, approvals, failures, appointments and exceptions. Support severity, ownership and read/resolved state; avoid alert overload.

42. KPI & ANALYTICS

Measure response time, follow-up completion, lead-to-appointment conversion, appointment-to-sale conversion, sales cycle, revenue, repeat customers, receivables, task completion, stock-outs and workflow failure rate. Define metrics clearly and use reliable source data.

43. AI SAFETY & CONFIDENCE

Atlas must know when it does not know. For uncertainty/high-risk actions: do not invent; retrieve approved knowledge, request information, request approval or escalate. Never turn uncertainty into a business commitment.

44. CLIENT CONFIGURATION

Make business hours, pipelines, follow-up intervals, approval thresholds, departments, roles, templates, inventory thresholds, notifications, escalations and enabled modules configurable.

45. WORKFLOW BUILDER

Where compatible, support triggers, conditions, actions, delays, approvals and escalations with validation, versioning, enable/disable, test mode and execution history. Prevent unsafe loops.

46. TEST / SIMULATION MODE

Before enabling important automations, allow simulation using test records. Show what would trigger, what actions would run, what external messages/actions would occur and whether approval is required. Test without affecting live customers, inventory, finance or communications.

47. AI AGENT REGISTRY

Atlas should know which specialist agents exist, their purpose, allowed tools, permissions, availability and health. Route tasks to the correct agent. Prevent circular delegation and duplicate execution.

48. WORK QUEUE & ESCALATION

Maintain queues for human tasks, AI tasks, approvals, failed workflows and escalations. Every queued item needs status, owner, priority, created time, due time and related entity.

49. BUSINESS PROCESS DISCOVERY

Atlas should help identify automation opportunities by analyzing authorized process information: repetitive tasks, duplicate entry, frequent delays, unanswered leads, bottlenecks and approval delays. Present opportunities as recommendations for human review rather than changing major workflows automatically.

50. MANAGEMENT OUTCOME

A boss should be able to open Atlas and understand the business quickly: what happened, what is happening, what is late, what needs attention, what requires approval, where sales are leaking, where customers are waiting, where inventory is low and what the AI workforce has done.

51. EMPLOYEE OUTCOME

Employees should spend less time copying data, searching conversations, remembering follow-ups, manually preparing repetitive updates and moving information between systems. Atlas should give them the right information and next action while keeping humans responsible for judgment.

52. CUSTOMER OUTCOME

Customers should receive faster, more consistent service, fewer forgotten follow-ups, smoother appointments/orders and appropriate escalation to humans. Automation must not create robotic dead ends.

53. IMPLEMENTATION PRIORITY

Do not attempt to build everything simultaneously. After auditing existing Atlas, create a gap analysis and phased implementation plan. Priority 1: identity/auth/security/database/tenant foundation. Priority 2: CRM/customer timeline/sales/follow-up/tasks. Priority 3: communications and calendar integrations. Priority 4: management dashboard/approvals/notifications. Priority 5: HR/inventory/orders/finance/marketing modules as required. Priority 6: advanced workflow builder, analytics and optimization. Adjust based on what already exists.

54. BEFORE WRITING CODE

First produce: A) Existing System Audit, B) Existing Features to Preserve, C) Missing Features, D) Security/Reliability Risks, E) Proposed Architecture Improvements, F) Database Changes/Migrations, G) Integration Plan, H) Workflow Map, I) Phased Build Plan, J) Files/components expected to change. Do not blindly rewrite the application.

55. WHEN WRITING CODE

Use the existing project's conventions where reasonable. Keep code modular, typed where applicable, maintainable and testable. Validate input. Handle loading/error/empty states. Do not hard-code secrets. Do not create fake production data. Do not silently swallow errors. Do not claim integrations work until verified.

56. DEFINITION OF DONE

A feature is not done because a screen exists. It is done when UI + backend + database + permissions + workflow + validation + error handling + audit trail + tests + integration behavior (where applicable) work together and the result solves the intended business problem.

57. FINAL ATLAS PRINCIPLE

CRM manages the customers. EDG connects the company. AI agents do the work. The database remembers the structured truth. Automations move the work. Integrations connect the tools. The dashboard lets management see and control it. ATLAS ORCHESTRATES THE WHOLE DIGITAL BUSINESS.

58. FINAL INSTRUCTION TO CLAUDE CODE

Do not create a new Atlas. Upgrade the Atlas that already exists. Start by auditing the current codebase and mapping existing functionality against this specification. Then show the gap analysis and implementation plan before making major architectural changes. Build incrementally, preserve working features, connect real workflows end-to-end, test them, and prioritize business outcomes over decorative software.
